YUSUF SHIRE

Charlotte, NC | (704) 957-7248 | LinkedIn | GitHub | yshire@uncc.edu

EDUCATION

University of North Carolina at Charlotte | B.S. Data Science | Expected Dec 2027

Organizations: Association of Data Science, Charlotte Sports Analytics Club, Somali Student Organization, Blacks in Technology

TECHNICAL SKILLS

Languages & Data: Python, SQL, R, Pandas, NumPy, SQL Server, SQLite | **ML & Analytics:** Scikit-learn, PyTorch, TensorFlow, Random Forest, Feature Engineering, Power BI | **Tools:** Git, GitHub, AWS, Matplotlib, Seaborn, Web Scraping

EXPERIENCE

Data Science & AI Co-op | Daimler Truck North America | Fort Mill, SC *Aug 2026 – Present*

- Built Random Forest and ensemble pricing models to predict commercial truck market values and identify opportunities across dealer and auction inventories.
- Engineered automated data pipelines integrating web scraping, validation, feature engineering, SQL Server, and Power BI for scalable reporting.
- Standardized tens of thousands of truck records for predictive modeling, inventory forecasting, market intelligence, and VIN-level lifecycle analysis.
- Designed a commercial truck intelligence platform combining ML, VIN tracking, SQL data warehousing, and executive dashboards for pricing insights.

Data Science Intern | Daimler Truck North America | Fort Mill, SC *May 2026 – Aug 2026*

- Developed an unsupervised ML framework to detect anomalous warranty patterns across 584 dealerships and 26,000+ paid claims.
- Evaluated Isolation Forest, LOF, DBSCAN, and One-Class SVM models using Python, Scikit-learn, Pandas, and SQL.
- Engineered dealer-level risk features and multi-model consensus scoring to rank high-risk dealerships and identify emerging anomalies.
- Presented executive scorecards, dealer watchlists, and actionable recommendations to stakeholders and leadership.

SELECTED PROJECTS

Warranty Dealer Anomaly Detection | GitHub

- Built an end-to-end anomaly detection pipeline across 26,000+ warranty claims using four unsupervised models.
- Automated preprocessing, consensus-based risk scoring, model evaluation, and executive reporting with Python and SQL.

Suicide Mortality Analysis | GitHub

- Analyzed 21 years of U.S. mortality trends using Python, Pandas, SQLite, regression, and data visualization.

NBA All-Star Predictor | GitHub

- Compared Logistic Regression and Random Forest classifiers; engineered features and evaluated model performance and feature importance.
